Dynatek® Fuel Injection Controllers

Dyna's® new fuel injection controllers are plug-in modules that offer three user-selectable base fuel curves that are designed to improve engine operation. Each can be modified to suit a wide variety of modifications. The adjustments are made via three potentiometers that adjust the fuel curve in the proper ranges for the application. Fuel mixture can be enriched

or leaned as required. The fuel injection controller uses the stock connectors for easy installation. There is no pc required for tuning or adjusting the fuel curves. There are no modifications to the stock ecu. In fact, removing the fuel injection controller returns the motorcycle to the factory configuration. Seven different models are available.
